

TERRAIN EDITOR MANUAL

PARTS OF THE UI

ELEMENT TYPES

There are two main terrain elements:

- nodes – round objects (can be found in the top left of terrain elements)
- edges – can be placed between each pair of nodes by pressing *connect* button after selecting two nodes – they can be rotated

For each node and edge, You can change its radius and colour.

Multiple nodes and edges can be grouped together by selecting them and pressing *group* button.

Groups are more complex types that can be:

- **rotated** by selecting a group and pressing on the yellow rotating arrow with either left or right mouse button and then dragging the mouse in the direction of choice; by holding **SHIFT** you can rotate group only by angles multiple of 15°
- **mirrored** horizontally or vertically
- **normalized** (if they aren't already) – if there are two nodes or edges of group in the same position they will be merged into one
- **enlarged** and **shrunk** by clicking one of the corners of the yellow cage and dragging your mouse **NEW!!!**

You can also set the rotation point of a group and control its speed and direction with settings in the bottom right corner. **NEW!!!**

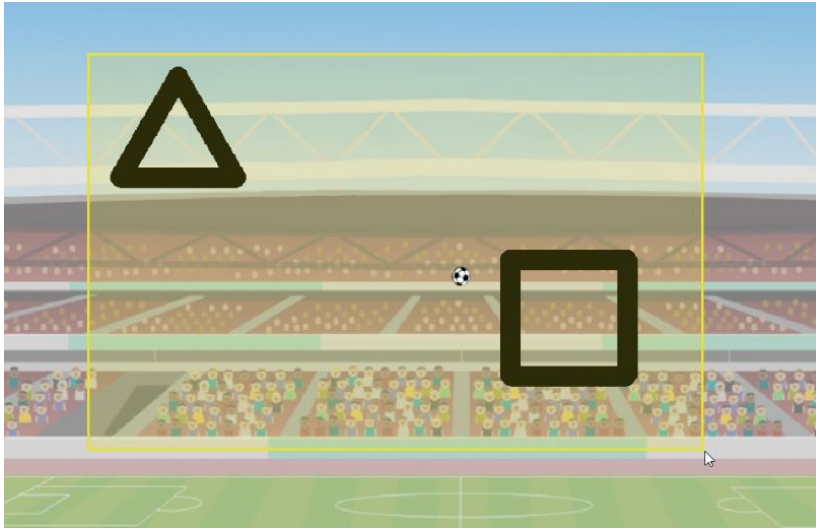

There are also **animated elements**:

- pendulum – You can drag and position weight of the pendulum by holding it with the left mouse click, also its radius; pendulum works best for small angles
- windmill – You can change its rotation speed and direction, also its size

SELECTING ELEMENTS:

There are multiple ways of selecting elements with different outcomes:

- pressing on the elements position in the playing field will always select a group the element is in, or the element itself if it isn't in any group
 - if there are multiple elements or groups on top of each other just keep pressing the same spot so different elements can be selected
- by pressing any row in nodes or edges table
 - this way you can select even those nodes or edges that are already in groups
- by making an area select (press any unpopulated spot on the map and drag your mouse)
 - this way you also select only basic elements, not groups
 - Hold **CTRL** to select multiple items or table rows.

AREA SELECT

MOVING ITEMS

If there is only one element selected (node, edge, group, animated) you can move it by pressing right mouse button inside its yellow cage and dragging your mouse.

All elements have their points of symmetry or interest (centre of node, symmetry axis of edge, centre of windmill...). – they are marked with purple dots and lines.

All element movements are „sticky“, meaning if the point of symmetry of element You are holding is close enough to the symmetry point of other element, Your element is automatically placed there.

Hold **SHIFT** to use **smart sticky** movement. (sticky around some coordinates (0.5, 0.25, 0.75...) and around axis of other elements when further away).

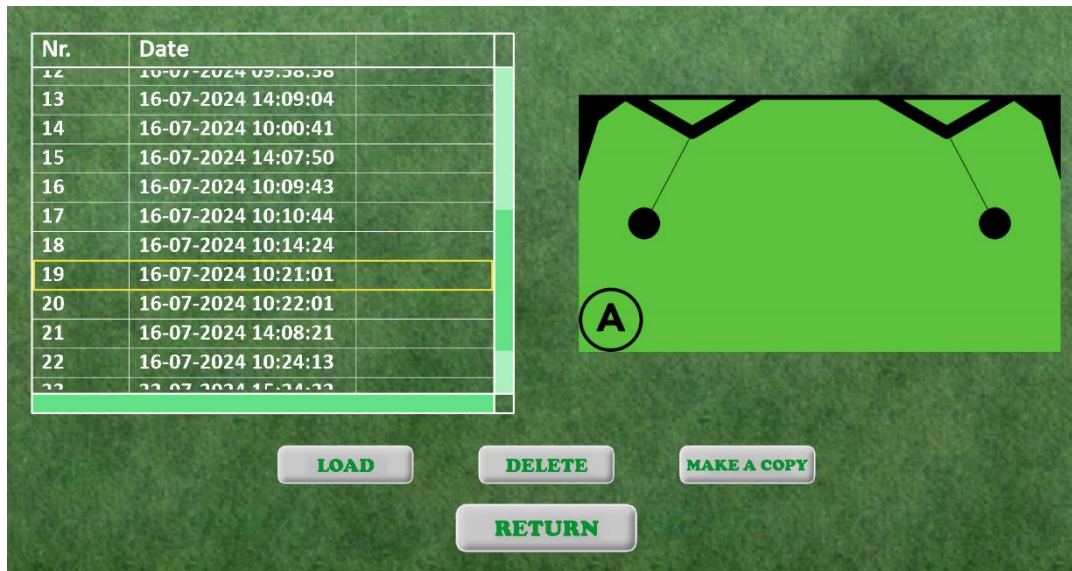

SIMULATING AND MOVING THE BALL

Use simulate button to simulate ball movement on your new map. Use arrow keys to control the ball.

Press the ball and drag your mouse to reposition the ball where you want it to be at the start of your matches.

MAPS

Use maps button to discover, load and delete all your and premade maps.

Don't forget to press save after making your map 😊.

USEFUL SHORTCUTS AND KEYS:

CTRL C – to copy any element or group (same as duplicate)

CTRL V – to place your copied element

CTRL – hold to select multiple elements

SHIFT – to use smart rotation (angles multiples of 15) and smart sticky movement

CTRL F – to enter full screen mode

DELETE (on your keyboard) – same as delete button

ESC – to exit the program

ARROW KEYS – to control the ball while in simulate mode
